

N-Palindromes

 by IEEEExtreme

[Problem](#)[Submissions](#)[Leaderboard](#)[Discussions](#)

Alice thinks that contest problem authors' obsession with palindromes is misplaced. She is much fonder of n -palindromes, which are words that are palindromes when the characters at exactly n positions are changed.

For example, Alice knows that her name (in lowercase) is a 2-palindrome, because she can create any of the following palindromes from her name by changing 2 characters: **alila**, **acica**, **elile**, **ecice**.

She also knows that her name is a 3-palindrome, because she can create palindromes by changing characters at 3 positions, e.g. **ecace** and **zlilz**. However, this is only a partial list, and she wants your help in determining the total number of such palindromes.

Note that the characters of an n -palindrome, including the n replacement characters, must all be lowercase English letters.

Input Format

The input starts with an integer t , on a line by itself, which gives the number of test cases.

Each test case is made up of an integer n followed by a lowercase string.

Constraints

$$1 \leq t \leq 20$$

$$1 \leq n \leq [\text{length of string}] \leq 500$$

Output Format

For each test case, you should output, on a line by itself, the total number of palindromes that can be created by changing exactly n characters of the given string. Since this number may be very large, you should output the number modulo $(10^9 + 7)$.

Sample Input

```
3
2 alice
1 racecar
3 alice
```

Sample Output

```
4
25
196
```

Explanation

The problem statement lists the four palindromes that can be made from the string **alice**, by changing 2 characters.

Since you can only change one character in **racecar**, you are constrained to changing the middle letter. This character can be changed to any of the 25 letters other than **e**.

For the last testcase, Alice has found that there are 196 palindromes that can be made from her name, by changing 3 characters.
